The genes are significantly homologous with organic cation transporters OCT1 and OCT2. The genes may used in drug development, particularly in the treatment of diseases due to abnormality of the organic cation transporter functions e.g. fatty liver, heart diseases and cancers, by controlling such as by inhibition or activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Administration of anti-tumour and anticancer drugs in combination with a transporter protein inhibiting agent allows the agents to penetrate into the diseased cells to enhance the drug action.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim

Also described are: (1) a method for screening compounds for their ability to regulate the transport of an organic cation into the cell, by generating a cell expressing OCTN3 at the cell membrane, contacting with the compound and organic cation, and observing the degree of transport of the organic cation; and (2) a method for screening compounds for their ability to be transported into the cell by OCTN3, by generating a cell expressing OCTN3 at the cell membrane, contacting with the compound and observing the degree of transport of the compound. OCTN3 can be used for the identification of regulators of the transport of organic cations (especially carnitine) into cells by OCTN3, for use as drugs. The present sequence represents the mouse OCTN2 amino acid sequence, which is used in an example from

                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents the mouse carnitine transporter protein OCTN2. The coding sequence of the corresponding human protein can be used as a target for diagnosis of systemic carnitine deficiency by detecting the presence of mutations in the sequence, especially seen in the disease juvenile visceral steatosis (jvs). The wild type OCTN2 gene can be used in the gene therapy of the disease state.
                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       organic cation transportation; mouse; OCTN2; diagnosis; systemic carnitine juvenile visceral steatosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240
```

The present invention describes a mouse organic cation transporter protein (OCTN3). Also described are: (1) a method for screening compounds for their ability to regulate the transport of an organic cation into the cell, by generating a cell expressing OCTN3 at the cell membrane, contacting with the compound and organic cation, and observing the degree of transport of the organic cation; and (2) a

OCTN3 can be used for the identification of regulators of the transport of organic cations (especially carnitine) into cells by OCTN3, for use as drugs. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mouse OCTN3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a protein with cation transporting activity. The genes are significantly homologous with organic cation transporters oCT1 and oCT2. The genes may used in drug development, particularly in the transment of diseases due to abnormality of the organic cation transporter functions e.g. fatty liver, heart disease and cancers, by controlling such as by inhibition or activation. Administration of anti-tumour and anticancer drugs in combination was a transporter protein inhibiting agent allows the agents to penetral into the diseased cells to enhance the drug action.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Genes homologous with organic cation transporters useful in design of new drugs for treatment of diabnormality of the transporter functions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        20-MAY-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a protein with cation transporting activity. The genes are significantly homologous with organic cation transporters OCT1 and OCT2. The genes may used in drug development, particularly in the treatment of diseases due to abnormality of the organic cation transporter functions e.g. fatty liver, heart diseases and cancers, by controlling such as by inhibition or activation. Administration of anti-tumour and anticancer drugs in combination with a transporter protein inhibiting agent allows the agents to penetrate into the diseased cells to enhance the drug action.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Genes homologous with organic cation transporters OCT1 and OCT2, useful in design of new drugs for treatment of diseases due to abnormality of the transporter functions

                                 The present invention describes a mouse organic cation transporter protein (OCTN3). Also described are: (1) a method for screening compounds for their ability to regulate the transport of an organic cation into the cell, by generating a cell expressing OCTN3 at the cell membrane, contacting with the compound and organic cation, and observing the degree of transport of the organic cation, and observing the degree of transport of the cyanic cation, and the cell by OCTN3, by generating a cell expressing OCTN3 at the cell membrane, contacting with the compound and observing the degree of transport of the compound. OCTN3 can be used for the identification of regulators of the transport of organic cations (especially carnitine) into cells by OCTN3, for use as drugs. The present sequence represents the mouse OCTN1 amino acid sequence, which is used in an example from

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16175) and the encoded proteins sequences (ABL101840-ABL16175) and the encoded proteins

The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLO1840-ABL16175) and the encoded proteins (ABB0737-ABB72072).

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or

which represent the human ORFX open reading frames 1 to 3161. The ORFX contributions and partitions such as cytostatic, hepatotropic; vulnerary; contributions have activities such as cytostatic, hepatotropic; vulnerary; cantipsoriatic; antiparkinsonian; nootropic; neuroprotective; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; costeopathic; antiparkinsonian; nootropic; immunosuppressant; antiparkinsonian; thrombolytic; coagulant; vasotropic; cantidiabetic; hypotensive; dermatological; immunosuppressive; antiparkinson; and antiparkinson; antipological; antithrematic; cantithyroid; and antiparentic. The sequences can be used for determining contributions and antiparentic to, or preventing or treating contributions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy contributed disorders, neurodegenerative disorders, osteoarthritis, corrections in hypothyroidism, cholesterol ester storage, systemic lupus carythematosus, severe combined immunodeficiency (SCID), AIDS, virial, contributed immuno autoimmune disorders. Asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            31-MAR-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is one of 251 novel human polypeptides encoded by a bone marrow-expressed polynucleotide. The polynucleotide and the polypeptide encoded by it are useful in the treatment of various immune deficiencies and disorders. The deficiencies and disorders may be genetic, may be caused by a viral (e.g. HIV), bacterial or fungal infection, or may result from an autoimmune disorder, a coagulation disorder (e.g. haemophilia), inhibition of tumour cell proliferation, suppression of an inflammatory response or treatment of a nervous system disorder such as Alzheimer's disease. Detection of the presence or increased expression of the polynucleotide or the protein it encodes is useful for the diagnosis and/or prognosis of one or more types of cancer. The polynucleotide and polypeptide can be used as nutritional sources or supplements and in the screening of chemical compounds as potential drugs.

 function
 MYOPATHY OR CARDIOMYOPATHY SIMILARITY: BELONGS TO THE CATION SUBFAMILY.
 SUBCELLULAR LOCATION: Integral membrane protein.
TISSUE SPECIFICITY: STRONGLY EXPRESSED IN KIDNEY, SKELETAL MUSCLE,
 CARNITINE DEFICIENCY (CDSP). CDSP IS AN AUTOSOMAL RECESSIVE DISONDER OF FATTY ACID OXIDATION CAUSED BY DEFECTIVE CARNITINE TRANSPORT. PRESENT EARLY IN LIFE WITH HYPOKETOTIC HYPOGLYCEMIA ACUTE METABOLIC DECOMPENSATION, OR LATER IN LIFE WITH SKELETAL
 HEART AND PLACENTA.
DISEASE: DEFECTS IN SLC22A5 ARE THE CAUSE OF SYSTEMIC PRIMARY
 FUNCTION: SODIUM-ION DEPENDENT, HIGH AFFINITY CARNITINE TRANSPORTER. ALSO TRANSPORTS ORGANIC CATIONS WITHOUT THINVOLVEMENT OF SODIUM. INVOLVED IN THE ACTIVE CELLULAR I

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

useful in de abnormality homologous with organic cation transporters OCT1 and OCT2, I in design of new drugs for treatment of diseases due to mality of the transporter functions

Claim <u>ب</u> Page 56-61; 97pp; Japanese.

The present sequence encodes a protein with cation transporting activity. The genes are significantly homologous with organic cation transporters OCT1 and OCT2. The genes may used in drug development, particularly in the treatment of diseases due to abnormality of the organic cation transporter functions e.g. fatty liver, heart diseases and cancers, by controlling such as by inhibition or activation. Administration of anti-tumour and anticancer drugs in combination with a transporter protein inhibiting agent allows the agents to penetrate into the diseased cells to enhance the drug action.

OCTN2; d
 This sequence represents the cDNA encoding the human carnitine transporter protein OCTN2. The sequence can be used as a target for diagnosis of systemic carnitine deficiency by detecting the presence of mutations in the sequence, especially seen in the disease juvenile visceral steatosis (jvs). The wild type OCTN2 gene can be used in th gene therapy of the disease state.

 CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC considerable are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical climating of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. AAS6419-AAS94564 represent novel human CC diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed on the printed of the printed o

 The present sequence encodes a protein with cation transporting activity. The genes are significantly homologous with organic cation transporters OCT1 and OCT2. The genes may used in drug development, particularly in the treatment of diseases due to abnormality of the organic cation transporter functions e.g. fatty liver, heart diseases and cancers, by controlling such as by inhibition or activation. Administration of anti-tumour and anticancer drugs in combination with a transporter protein inhibiting agent allows the agents to penetrate into the diseased cells to enhance the drug action.

 is sequence represents the cDNA encoding the mouse carnitine ansporter protein OCTN2. The corresponding human sequence (AAA09889) in be used as a target for diagnosis of systemic carnitine deficiency detecting the presence of mutations in the sequence, especially seer the disease juvenile visceral steatosis (jvs). The wild type OCTN2 ne can be used in the gene therapy of the disease state.

 The present invention describes a mouse organic cation transporter protein (CCTN3). Also described are: (1) a method for screening compounds for their ability to regulate the transport of an organic cation into the cell, by generating a cell expressing CCTN3 at the cell membrane, contacting with the compound and organic cation, and observing the degree of transport of the organic cation; and (2) a method for screening compounds for their ability to be transported in the cell by OCTN3, by generating a cell expressing OCTN3 at the cell membrane, contacting with the compound and observing the degree of transport of the compound. OCTN3 can be used for the identification of regulators of the transport of organic cations (especially carnitine) into cells by OCTN3, for use as drugs. The present sequence encodes

The present sequence encodes a protein with cation transporting activity. The genes are significantly homologous with organic cation transporters OCT1 and OCT2. The genes may used in drug development, particularly in the treatment of diseases due to abnormality of the organic cation transporter functions e.g. fatty liver, heart diseases and cancers, by controlling such as by inhibition or activation. Administration of anti-tumour and anticancer drugs in combination with a transporter protein inhibiting agent allows the agents to penetrate into the diseased cells to enhance the drug action.
 1544
 Genes homologous with organic cation transporters OCT1 and useful in design of new drugs for treatment of diseases due abnormality of the transporter functions

 This sequence represents the genomic DNA encoding the human carnitine transporter protein CCTN2 (AAY83929). The complete genomic sequence contains 9 introns dispersed throughout the gene. The gene can be used as a target for diagnosis of systemic carnitine deficiency by detecting the presence of mutations in the sequence, especially seen in the disease juvenile visceral steatosis (jvs). The wild type OCTN2 gene ca

 The present invention describes a method for detecting the presence polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to the presence of genetic polymorphisms associated with inflammatory disease and correlating their occurrence with disease states. They used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a generation and polymorphic site described in the exemplification of the properties.
